

Tlek_ADVBS

During the whole development period the main problem was lack of time. Each member in our team currently working as developers in different companies, that's why we almost forgot about university. At the beginning we were quite enthusiastic about this project, we have had a lot of ideas on how to perform on this and that, what to use and how to attach it.

First we wanted to use ASP.NET C# and MsSQL, then later on, we rearranged in-team roles what lead to changing our language of implementation to JavaScript. There is a member whose main language is JS (Tlek). He took UI implementation part to himself. Issabek and Meirzhan were helping him out with little js functions and SQL part.

From first to next few phases it was not that difficult, I mean our knowledge of SQL from previous classes was enough to handle them, but from lecture to lecture it was getting more clear, that without studying the material we wont be able to do these tasks. But thanks god, your explanation in tasks documentation was good enough to take care of them without googling things like "how to" or "what to do if".

Another problem was that for some phases 1 week was too much, and for another of them 1 week was not enough.

Well, it is just our point of view, maybe we just had to be more focused on studying. Anyway it's late to tell what's right and wrong. Wish you all the best!
